

ESCAPE

European Science Cluster of Astronomy &
Particle physics ESFRI research Infrastructures

Managed Database

Pierre Chanial, EGO

Why?

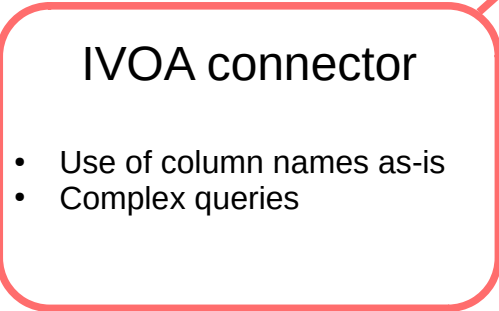

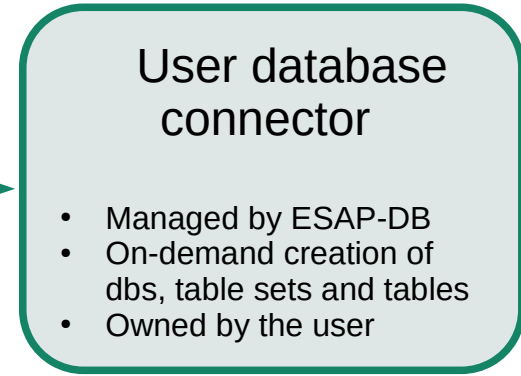

1. Access to all European research data
2. Access to world-class data services
3. Clear rules of use and service provision
4. FAIR data tools, training and standards
5. Sustainable after the grant

Why?

- Databases provide space to store and **index** user data
 - To do further analysis
 - Easy to be combined with other data sources through the data lingua franca: SQL
 - Cross-fertilization: new science
- But database admin takes a lot of time
 - Setting up, backups, redundancy

Current status: Access to isolated tabular data sources

ESAP-DB data model

```
SELECT did FROM `project_id.dataset_id.table_id` WHERE metadata='xyz'
```

ex: 'escape_datalake'

Rucio's
Scope

Rucio's Dataset or
Container

ESAP-DB stack

- Back-end (docker-compose):
 - ESAP-DB: FastAPI / Gunicorn (uvicorn)
 - DB admin (postgresql 12)
 - 2 x DB projects (postgresql 12)
 - PGAdmin
 - soon: Celery & Flower
- ESAP-DB client (Python)

Next step: federation of heterogenous data sources

SQL

Trino / openLookEng: SQL-to-everything federation

Data-lake connector

- Access to metadata
- NoSQL Elastic Search?

User database connector

- Managed by ESAP-DB
- On-demand creation of DBs, table sets and tables
- Owned by the user

IVOA connector

- Use of column names as-is
- Complex queries

ESFRI connector

- Standardized, pre-formatted queries

External database connector

- Most RDBM
- Most NoSQL DB

If you want to go fast, go alone

If you want to go far, go together
